Operating System Components and Services

The operating system components work together to improve the overall performance of the computer. The process manager schedules and executes processes efficiently. The memory manager allocates memory properly to avoid wastage. The file manager organizes and manages files for quick access. The device manager controls input/output devices and ensures smooth communication between hardware and software. The security manager protects the system from unauthorized access and keeps data safe. Together, these components provide efficient resource utilization, faster execution, reliable file management, smooth device operation, and better system security.

System Calls and Operating System Services

System Calls and Operating System Services

operation	Category	Example system call
Create process	Process Control	fork ()
Read File	File Management	read ()
Allocate memory	Memory Management	mmap ()
Send data through pipe	Communication	pipe ()
Exit process	Process Control	exit ()
